## REFUSE COLLECTION AND SOLID WASTE DISPOSAL PLAN CLEVELAND COUNTY, NORTH CAROLINA

### I. INTRODUCTION

The quest for better refuse disposal in Cleveland County accelerated in March of 1971 when the North Carolina State Board of Health adopted the RULES AND REGULATIONS PROVIDING STANDARDS FOR SOLID WASTE DISPOSAL. These standards provided the legal and planning base for an effective solid waste management program in the State of North Carolina from which this report is derived.

#### II. DESIGN CRITERIA

Solid waste is produced by all constituents of the county community. Residences, commercial establishments, and industry each make a contribution to the total refuse disposal problem. Variations in quantity occur from each of these contributors according to many variables. An average estimate of quantity contributed by each member of the county community is needed for the design of disposal facilities for the county.

### III. REFUSE UNIT QUANTITY

Records of actual collected refuse weights began on a selected basis beginning December 1975 and continuing for about a one (1) month period. (See Appendix A). Data from these records indicate an average refuse quantity of approximately 1.8 lb. per person per day. National averages approximate the data obtained in the selected weighings and confirm their validity and justification for use.

A recently completed landfill site, shown on the accompanying plans, was checked with the above figure and determined that the actual waste quantity and the estimated quantity was sufficiently equal to justify the design rate of 2.1 lb/cd at a 1,200 pounds per cubic yard (lb/yd.<sup>3</sup>) compaction rate.

### IV. REFUSE PROJECTED QUANTITY

Presently there is an estimated 85% of the county's residents utilizing the landfill site by depositing their household refuse in one of the county's eight (8), fourty (40) cubic yard container sites. There are an additional four (4) sites planned which is estimated to be made available by 1979 at which time an estimated 95% of the county's population will be utilizing the landfill.

The county has granted franchised areas to three (3) independent contract haulers. These haulers contract with the county to maintain and empty the 40 yard containers at the various sites throughout the county. The 40 yard container site method, and private contract haulers, as opposed to county owned and operated facilities, has proved very feasible with many advantages to the county. This type system operation will probably remain and will be utilized in the future. (Refer to Sheet 2 of the plans).

Population data, on which estimated quantities of refuse are based, are taken from the report "Population and Economy Study" by the Isothermal Planning and Development Commission, February, 1974. Appendix B is a reproduction of the population projections used as estimated in the report.

To determine the yearly quantity production rate of refuse it is assumed that the 2.1 lb/cd rate will include the domestic and industrial refuse quantity and will remain approximately constant for the design period.

Also, the projected refuse quantity will be linearly proportional to the population growth rate with 85% present and 95% future use rate.

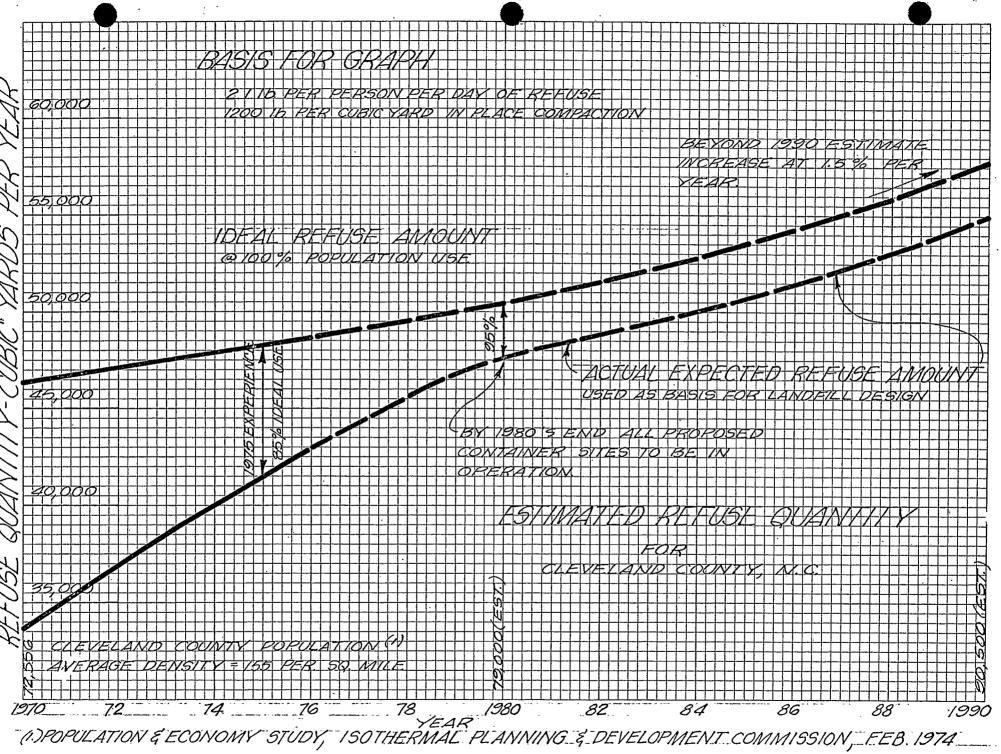

Graph One (1) is a representation of the projected yearly refuse production quantity. Differences between the ideal production and expected production can be attributed to open burning, open dumping and other factors that contribute to unsightly illegal dumping and home burning of refuse.

### V. REFUSE COMPOSITION

Refuse collected and disposed of at the landfill site consists of residential, commercial and industrial refuse. Residential and commercial refuse are of typical composition while industrial refuse consists heavily of textile waste due to the concentration of textile industries within the county. Extremely bulky materials are absent from industrial refuse especially in the textile industry. Thus a compaction rate of 1,200 lb/yd.<sup>3</sup> is not unrealistic and is used for volume design.

## VI. REFUSE OPERATIONAL PLAN

The Cleveland County Landfill is operated by the authority of the Cleveland County Board of Commissioners, Mr. Jack Palmer, Jr., Chairman. The County Manager, Joseph Hendrick, delegates the direct responsibility for system operation to the Cleveland County Health Department, Sewer, Water & Air Section, Mr. G. W. Moore, Chief. Mr. Moore has the management responsibility to assure compliance with the State Health Department requirements. Also, Mr. Moore has the responsibility of insuring adequate collection throughout the county at a reasonable cost to the

ENGENE DIETZGEN CO. MADE IN U. S. A. NO. 340-10 DIETZGEN GRAPH PAPER 10 X 10 PER INCH county's residents and coordination of the systems working with the landfill supervisor on the site.

Mr. Lee Self is the Landfill Supervisor whose responsibility is to place the operational plans into a positive fill operation with assistance from 5 employees for operation and maintaining the necessary equipment and materials.

### VII. LANDFILL OPERATIONAL PLAN - GENERAL

Reference should be made to the accompanying drawings and the "Summary of Landfill Capacity" shown in Appendix C. Area development should follow the plan development schemes with the expected year completion as shown in the summary. Minor alterations of this scheme can be expected but the plan should generally be followed with plan up-dates submitted periodically as necessary.

Fourty — cubic yard public containers are placed throughout the county where pick-up is on a daily or as necessary basis. Eight (8) sites are presently operational with an estimated four (4) additional sites to be in operation by 1980. All public container sites are open 24 hours for the convenience of the county's residents. (Exception: Patterson Springs site has a compactor unit and is open from 8:00 AM to 7:00 PM daily).

The landfill site is open from 8:00 AM to 4:30 PM, Monday through Saturday and is restricted to prevent scavenging and illegal dumping.

The existing landfill site is expected to be completed near the year 2000.

#### EQUIPMENT.

Landfill equipment consists of the following inventory:

- A. 1 Rex Compactor Dozer
- B. 1 Front-End Loader
- C. 1 Crawler Dozer
- D. 1 Earth Pan
- E. 1 Motor Grader

(See Appendix D for more detailed inventory.)

## VIII. FUTURE SITE USE

The entire landfill site is leased by the County of Cleveland from the City of Shelby for use as a solid waste disposal area. Upon completion of various sections of the landfill operation, these sections revert to the City for their use.

The City has leased a portion of completed sections for a skeet shooting range and other portions are used for the police firing range. It is expected that some type of recreational facilities will be planned for other areas of the landfill as sections are completed. No other definite plans by the City are indicated at this date.

SUBJECT

SOILS REPORT - Cleveland County Landfill

Asheville Field Office (Buncombe County) | MESSAGE (WRITE CONCISE MESSAGE SIGN AND FORWARD PARTS 1 AND 2 TO ADDRESSEE. RETAIN PART 3)

Jerry V. Stimpson Soil Scientist

Attached is the soils report on the Cleveland County landfill site.

Here are some observations noted during the investigation that you may want to consider and include in the overall report.

Consideration should be given for further study in the Parolet Soil (324 D) for depth to bedrock, since we hit rippable rock at 3½ feet, also the Cecil (31 B) in the woods (stony symbols) should be looked at to determine if there are enough stones to affect compaction of this material as cover soil.

The county should consider bushogging the areas that are not going to be used in the near future, this done periodically could possibly avoid greater expense later when these areas are put to use.

Areas that are cleared should not be left bare for long periods of time, some of these areas are steep and could cause excessive runoff.

The pond on the back side of the site could possibly be used as a catch basin when activity is begun in the area.

## UNIT OF GOVERNMENT

REQUESTED BY Pete Moore LOCATION Cleveland County	, 
ASSISTED BY <u>Jerry Stimpson &amp; Jim Boggs</u> DATE <u>5/7/75</u>	
SITUATION: Mr. Pete Moore of the Cleveland County Health Department requested	
that Soil Conservation Service personnel be present to participate in a detaile	đ
Char Boll Gonesivation Scribb Personner	
soil investigation of the Cleveland County landfill.	
FINDINGS: 1. Seven borings were made with well drilling equipment at selected	! 
sites on the landfill.	
2. It was determined that at all sites, the soil is of the Cecil	<del></del>
Series, this soil is a deep, well drained, red, clayey soil. On the steeper	-
slopes a shallower version of the Cecil Series occurs. The subsoil of these	
soils is kaolinitic clay and when wet is plastic and sticky; however, these	
clays do not shrink and swell excessively therefore, compaction should not be	
	• • '
SUXGESTERNSOKENTONXSX extremely difficult.	<del></del>
3. At six of the seven borings hard rock was not encountered above	•
J. At BIX of the Beven Borrings hard room was not encountered above	
25 feet, the exception was at boring #5 where hard rock was encountered at 13 f	eet
	_
4. In each soil profile the subsoil was red, firm, clay to a depth	<u>ot</u>
about four feet; on an average from about four feet to twelve feet the soil was	; .
mottled yellow and red, friable, loam; at 12 feet rippable rock fragments and	<del></del>
quartz veins were encountered that would crush between the thumb and index fing	œr,
with first the work for months in money at 1 and harmon hand to a doubt of about	
with depth the rock fragments increased and became hard to a depth of about	<del></del>
twenty-five feet at which point hard seil was encountered, at site number 3 room	k
